

Invention Profile

Feed Rock Change Table

Inventor Objective: Seeking investors to expand distribution

IP Status: Standard Patent AU2005239763, PCT WO05107533A1,
US20070067908A1

Development Stage: Product available for sale and distribution

With the birth of their second child Ram and Sowjanya Gudipati came up with an invention, which provides maximum support and comfort for new babies and their mums (or dads) during feed and change times. The innovative Feed Rock Change Table is a multi-function nursery product, which can be configured to provide:

- Flat bed for breast or bottle feeding;
- Flat bed for manual and automatic rocking;
- Hammock style sleep-in rocker; and
- Flat bed as change table.

The product was primarily designed to help position baby for breast or bottle feeding while keeping baby close and nestled to their caregiver. The product helps not only to better position baby but also eases potential back, neck or even wrist strain for caregivers.

The Feed Rock Change Table can also be used as a baby rocker/bouncer; using restraint straps baby can be positioned to enjoy a safe and comfortable motor-driven rocking motion. Then with a few quick twists and turns the Table can be transformed into a clean, transportable baby change table.

The Feed Rock Change Table has been tested in the marketplace with placement of prototypes at a number of child care centres. Feedback received has been positive and has led to the manufacture of further tables, which are now commercially available. To continue to expand manufacture and distribution of the Feed Rock Change Table the Gudipatis are now seeking investors to become involved.
